SUMMARY

Full stack software engineer finishing a B.Tech at NIT Jalandhar in 2026, with a habit of shipping backend systems that still hold up once real traffic hits them. Recent work includes a Razorpay backed payments platform that stayed correct across 200+ concurrent bids using webhook verified idempotent transactions, and a multitenant RAG pipeline that processed 500+ documents at over 90% extraction accuracy while cutting incorrect LLM responses by roughly 40% against a no retrieval baseline. Comfortable owning a feature from spec to production and genuinely interested in the parts of engineering that involve concurrency, API design, and systems that fail safely instead of silently.

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, SQL

Backend & Distributed Systems: Node.js, Express.js, Fastify, FastAPI, RESTful API Design, System Design, Distributed Systems, Concurrency Control, Rate Limiting, Idempotency, Multitenant Architecture, Async Job Processing (BullMQ)

Cloud, DevOps & Reliability: Docker, Terraform, Vercel, GitHub Actions (CI/CD), Upstash Redis, Linux, Bash Scripting, Git, Microsoft Azure

Databases: PostgreSQL, MongoDB, Redis, Neon DB, Supabase, pgvector, Prisma (ORM), Row Level Security (RLS)

Security & Auth: JWT, RBAC, OAuth, Webhooks, Payment Gateway Integration, SSRF safe request validation

AI, LLM & Agentic Systems: RAG, LLMs, Multiagent Systems, Embeddings, Semantic Search, Vector Search, OCR, TensorFlow, PyTorch, Claude Code, Model Context Protocol (MCP)

Frontend: React.js, Next.js

EXPERIENCE

Software Engineering Intern, Reach Inc.

Jun 2025 to Jul 2025

- Shipped backend logic and REST API endpoints in Node.js and Express.js for new product features, taking each one from an initial spec through to production without needing much handholding.
- Extended core site functionality through server side integrations that matched the team's existing REST API conventions and code review standards.
- Worked closely with the engineering team through architecture discussions, implementation, testing, and release, and picked up the team's review and deployment habits within the first couple of weeks.

Open Source Contributions, GitHub

Sep 2026

- [Apache Magpie PR #1379](#): Reduced the optimize-skill context footprint from 3,995 to 3,038 tokens while preserving seven optimization passes and safety gates; added two behavioral eval fixtures and kept the full suite at 7/7.
- [Kestra PR #19805](#): Replaced 55 explicit any usages across 10 TypeScript and Vue store files with SDK, domain, and narrowed unknown types; passed application, design-system, and test type checks, lint, and 109 focused unit tests.

PROJECTS

MYDAY: Full Stack Calendar Date Marketplace

[LINK](#)

Next.js, TypeScript, PostgreSQL (Supabase), Clerk, Razorpay, Upstash Redis

- Built the bidding logic so a new claim has to beat the current one by at least 10% (or \$1, whichever is larger) before it is accepted, enforced with Postgres partial unique indexes and webhook verified idempotent transactions, so exactly one claim stays valid per date even across 200+ simultaneous bids.
- Paired Clerk authentication with Supabase Row Level Security so every request is authorized server side, then added dual currency (INR/USD) checkout through Razorpay with signature verified webhooks, Redis backed rate limiting, and automatic deployment to Vercel through GitHub Actions.

ThrottFlow: Node.js Rate Limiting Package

[LINK](#)

Node.js, JavaScript, Express.js, PostgreSQL, npm, ES Modules

- Published ThrottFlow, an MIT-licensed npm package implementing exact sliding-window and token-bucket rate limiting with bounded in-memory storage and a PostgreSQL store for quotas shared across multiple Node.js instances.
- Built Express middleware with 429 and Retry-After responses plus fail-closed 503 behavior on storage errors; hashed subject keys with SHA-256 and used PostgreSQL transactions with row-level locks to keep concurrent decisions consistent.

Finora: Multitenant Document Intelligence & RAG Platform

[LINK](#)

React, TypeScript, Node.js, Fastify, Python, FastAPI, PostgreSQL, pgvector, Redis, BullMQ, Docker

- Built an async pipeline for PDF ingestion, OCR, and schema driven structured data extraction that processed 500+ test documents at over 90% field extraction accuracy.
- Added a RAG layer (chunking, embeddings, pgvector, semantic search) that cut incorrect or irrelevant LLM responses by roughly 40% against a no retrieval baseline, then locked the platform down with JWT auth, refresh token rotation, RBAC, and per tenant isolation, shipped as Dockerized services.

Prepwise: AI Interview Prep Kit

[LINK](#)

Next.js, Express.js, TypeScript, MongoDB, Zod, Gemini API, OpenAI API

- Built a TypeScript monorepo (Next.js frontend, Express API, and 4 shared packages) that turns a job description and a company URL into an editable interview prep kit, complete with company research, interview questions, flashcards, and a day by day study schedule.
- Wrote an SSRF safe research crawler that checks every request and every redirect against 7 blocked network ranges (private, loopback, link local, metadata, multicast, reserved, and documentation addresses), and backed the generation pipeline with an idempotent MongoDB job queue plus a coverage checker that will not let a kit finish until 100% of must have requirements are covered.
